

Reproduktorové kabely Inakustik Reference NF-41

These cables transmit the analogue music signal separately for each channel.

As the music signal is very weak and sensitive at this part of the hi-fi system, the cable needs to be of special construction. Good screening is especially important here. This is why audio cables are co-axially constructed, so from one signal conductor and a screening which is also used as a return lead. Symmetrical or double symmetrical constructions guarantee an even better transmission.

Reach the goal with controlled precision. The high-quality 5.1 audio cable sets are converted with six gold-plated RCA-60 or RCA-80 cinch plugs made of full-metal. In the NF-21 5.1 two signal conductors are arranged **symmetrically**, in the NF-41 5.1 four are arranged in double symmetry. Also for SACD use. The labelling is unambiguous and makes the allocation of channels and running direction easy. **Reference class**. The muscle man.
